A method, program and system to verify that an electronic message was sent to the intended recipient and to provide message the electronic with originator of independent confirmation that verifies the time and date that the electronic message was sent and the time and date that it was delivered. A secondary purpose is to verify the identity of an intended electronic mail recipient prior to the intended recipient's receipt of the electronic mail. The inventive device includes a central processing unit to facilitate the receipt and delivery and confirmation of electronic mail. The processing unit tracks incoming and outgoing electronic messages; tracks customer accounts and identities; archives all relevant information for future use and/or reference; and disseminates the foregoing data to regional/local servers and clients as necessary.
